I am

An insurance fraud investigator.

An insurance company analyst.

A data analyst working in an insurance company.

An insurance company manager.

I'm trying to

Identify fraudulent insurance claims among thousands of submitted claims.

reduce financial losses caused by fraudulent insurance claims.

analyze claim data to detect patterns of fraudulent behavior.

ensure that legitimate customers receive claim approvals quickly.

But

manually analyzing every claim takes a lot of time and effort.

traditional manual verification methods are slow and inefficient.

large volumes of claim records make manual analysis difficult.

fraudulent claims increase verification workload.

Because

fraudulent claims often resemble legitimate ones and require deep investigation.

large volumes of claims make it difficult to detect fraud patterns quickly.

traditional systems do not automatically identify suspicious claim patterns.

fraud investigations slow down the processing of genuine claims.

Which makes me feel

overwhelmed and concerned about missing suspicious claims.

frustrated and worried about increasing fraud risks.

challenged and in need of better analytical tools.

concerned about customer satisfaction and operational efficiency.
